

No efflorescences?

...but how?

With the Omnicon Group system

- Based on three pillars

The following steps are crucial

1

Recording of the actual state and determination of the optimization possibilities and needs of the customer.

2

Optimization of the starting product using Omnicon admixtures and monitoring of the optimization process using the QAVR. Determination of values for a reproducible starting product.

3

Protection and refinement of the concrete product using an individually adapted surface protection system (both wet and dry side).

Tried and tested
